HEPATITIS C?

Assess your risk.

More than 100,000 people in Massachusetts have hepatitis C. Most of them don't know it. Medical care can help prevent serious liver damage.

You're at risk if you have:

- ☐ received a blood transfusion before 1992
- ☐ injected drugs, even once
- ☐ had sex with an infected partner

If you are at risk, get tested. For more information, contact your health care provider, call our hotline, or visit our website.
